

Lab 4

Overview

In this lab we will learn reading and processing text files

Steps

1. Copy the following paragraph into a text file named **sample.txt** and save it to your machine

python was conceived in the late 1980s as a successor to the abc programming language . which was inspired by setl . capable of exception handling and interfacing with the amoeba operating system. its implementation began in december 1989. van rossum shouldered sole responsibility for the project . as the lead developer . until 12 july 2018 . when he announced his permanent vacation from his responsibilities as python's benevolent dictator for life . a title the python community bestowed upon him to reflect his long-term commitment as the project's chief decision-maker. in january 2019 . active python core developers elected a five-member steering council to lead the project . python 2.0 was released on 16 october 2000 . with many major new features such as list comprehensions . cycle-detecting garbage collection . reference counting . and unicode support. python 3.0 . released on 3 december 2008 . with many of its major features backported to python 2.6.x and 2.7.x. releases of python 3 include the 2to3 utility . which automates the translation of python 2 code to python 3. python 2.7's end-of-life was initially set for 2015 . then postponed to 2020 out of concern that a large body of existing code could not easily be forward-ported to python 3. no further security patches or other improvements will be released for it. currently only 3.8 and later are supported . in 2021 . security updates were expedited . since all python versions were insecure because of security issues leading to possible remote code execution and web-cache poisoning. in 2022 . python 3.10.4 and 3.9.12 were expedited and 3.8.13 . because of many security issues. when python 3.9.13 was released in may 2022 . it was announced that the 3.9 series would only receive security fixes in the future. on 7 september 2022 . four new releases were made due to a potential denial-of-service attack: 3.10.7 . 3.9.14 . 3.8.14 . and 3.7.14. as of october 2023 . python 3.12 is the stable release . and 3.12 and 3.11 are the only versions with active support. notable changes in 3.11 from 3.10 include increased program execution speed and improved error reporting . python 3.12 adds syntax to the language . the new keyword type . and 3.11 for exception handling . and 3.10 the match and case keywords . for structural pattern matching statements. python 3.12 also drops outdated modules and functionality . and future versions will too . see below in development section . python 3.11 claims to be between 10 and 60% faster than python 3.10 . and python 3.12 adds another 5% on top of that. it also has improved error messages . and many other changes. since 27 june 2023 . python 3.8 is the oldest supported version of python . due to python 3.7 reaching end-of-life

2. From Windows start menu, Open Python IDLE
3. Go to the File menu and select "New File"

4. Copy the following program to the window

A screenshot of a Python IDE window titled '*lab4.py - H:\My Drive\Courses\Prep 2023\homework\lab4.py (3.12.0)*'. The window contains the following Python code:

```
name = input('Enter file: ')
handle = open(name, 'r')

all_words = list()
for line in handle:
    words = line.split()
    for word in words:
        all_words.append(word)

>>>
>>> print(len(all_words))
>>>
```

The code is executed, and the output shows the prompt 'Enter file: E:/sample.txt' followed by the number '471'. The status bar at the bottom indicates 'Ln: 7 Col: 0'.

5. Go to the File menu and select “Save”, and save the program at the Desktop. Please use your student-id as the name of the file, and use “py” as an extension to the program
6. Go to the Run menu and select “Run Module” and see the output

Exercise 1:

- What is the meaning of the number that was printed at the program?
- Change the program to print the list named `all_words`

Part 2: Words Count

In Part 1, we read the file and stored it into a list. Some words are repeated multiple times in the file. In this part we want to get unique words in the file, so we will modify the program as follows:

A screenshot of a Python IDE window titled 'lab4.py - H:\My Drive\Courses\Prep 2023\homework\lab4.py (3.12.0)'. The window shows a Python script that reads a file, splits it into words, and counts the unique words using a dictionary. The script is as follows:

```
name = input('Enter file: ')
handle = open(name, 'r')

all_words = list()
for line in handle:
    words = line.split()
    for word in words:
        all_words.append(word)

unique_words = dict()
for w in all_words:
    unique_words[w] = 0

>>> print(len(unique_words))
```

The script is executed, and the user enters 'E:\sample.txt'. The output is '246'. The status bar at the bottom of the window shows 'Ln: 291 Col: 0'.

Exercise 2:

- What is the meaning of the number that was printed at the program now?
- Change the program to print how many times each word is repeated.
Hint: In the lecture, we see a program that was doing that exactly
- What is the most frequent word in the file?
Hint: In the first lecture, we see a program that was doing that exactly

Part 3: Searching

Now let us allow the user to search for words in the file.

Exercise 3:

It is required that you modify the program to act as follows

1. You will ask the user for the file path and for a word to search for
2. If the word exists in the file, you will tell the user how many times it is there

```
Enter file: E:/sample.txt
Enter the word: python
The word "python" was found 22 times in the file
```

3. If the word doesn't exist, you will tell the user that it doesn't exist as follows

```
Enter file: E:/sample.txt
Enter the word: java
This word does not exist in the file
```
